

PRODUCT DATA SHEET

Optical Fiber Composite Overhead Ground Wire Cable(OPGW)

Application:

OPGW optical cables are mainly used in 500KV, 220KV and 110KV voltage lines. They are affected by factors such as power failure, safety and so on, and are mostly applied to new lines. The applicable characteristics of OPGW are:

- High voltage over 110kV lines have large span (usually above 250M).
- It is easy to maintain and is easy to solve for line crossing problem. Its mechanical characteristics can meet the large span of the line.
- The outer layer of OPGW is metal armor, which has no effect on high voltage corrosion and degradation.
- OPGW must stop power and power loss in construction, so OPGW should be used in the new high voltage line above the new 110kV.
- In the performance index of OPGW, the larger the short circuit current is, the more need the good conductor to amour, the more the tensile strength is reduced, and the short circuit current capacity should be improved under the condition of the tensile strength. Only increase the cross-sectional area of the metal, which leads to the increase of cable diameter and cable weight, which raises safety problems for the strength of transmission line towers.

Characteristic:

- It has the dual functions of ground wire and communication optical cable and eliminates the huge cost of repeated erection and maintenance.
- It is not necessary to consider the best hanging point and electric corrosion factors on the top of the overhead transmission line tower.
- During the transformation of the old line, the outer diameter and tension weight of the optical cable can match well with the other ground wire.
- The transmission capacity is large, the communication quality is high, and the reliability is good.
- With superior mechanical and electrical properties.
- It has good safety performance, long service life, and is not easy to be shot by destructive weapons.
